CSE 27

- The divergent and convergent thinking's also called the 'Double Diamond Model', which is a design thinking process developed by the UK design council. It shows how designers work in two main phases of divergent (broad exploration) and convergent (focused narrowing) thinking.

- It looks like two diamonds side by side.

◦ Diamond 1 :- understand the problem (Discover + Define)

Diamond 2 :- create the solution (Develop + Deliver).

- The 4 steps are - Discover → Define → Develop → Deliver.

(1) Discover (Open up) :- • Goal : Explore and understand the problem deeply.

• Activities : Research, observation, interviews, user journeys.

• Example : A transport company notices passengers are unhappy. They observe commuters, run surveys, and find the real frustration's not the buses being slow but not knowing when the next bus will arrive.

(2) Define (Narrow down) :- • Goal : Analyse the findings and clearly define the challenge.

• Activities : Synthesize insights, identify patterns, create problem statements.

- Example: Instead of "make buses faster", define the problem as - "How might we help passengers feel informed and less anxious about waiting?"

(3) Develop (open up again) :- • Goal: Generate and test multiple solutions.

- Activities: Brainstorming, prototyping, experimenting, co-creation with users.

- Example: The team creates ideas like mobile apps, digital bus stop displays, or SMS alerts. They quickly prototype and test them with passengers.

(4) Deliver (Narrow down & launch) :- • Goal: Finalize the best solution, refine it, and implement.

- Activities: Pilots, launch, feedback loops, scaling.

- Example: They launch a real-time bus tracking app. Passengers can now see exact arrival times, reducing stress and improving satisfaction.

Double Diamond = Explore the problem (Discover + Define) → Create the solution (Develop + Deliver)

HEALTHCARE -

How might we design a system that provides affordable, accessible, and timely healthcare service to people living in rural and remote areas?

- Healthcare's one of the most essential needs of society, yet millions of people, especially in rural regions, face difficulties in accessing proper medical care due to a lack of hospitals, doctors, and modern facilities. This 'How might we' question encourages the exploration of innovative solutions such as mobile health units, telemedicine, digital health platforms, and community health programs. The aim's to bridge the gap between urban and rural

healthcare systems, ensuring that every individual has the right to quality medical treatment regardless of their location or income.

EDUCATION SECTOR -

How might we design and create an engaging and inclusive learning environment that uses technology to improve the quality of education for all students?

- Education today faces challenges such as lack of motivation among students, unequal access to resources, and outdated teaching methods. This 'How might we' question focuses on how technology and innovative teaching methods can transform the learning experiences by integrating tools like digital classrooms, interactive content, online platforms, and personalized learning, education can become more engaging, accessible and effective for students from diverse backgrounds. It also promotes creativity, collaboration and continuous learning in the education systems.

• Conclusion - Framing 'How might we' questions helps in identifying opportunities for innovation and problem-solving. In both the healthcare and education sectors, these questions guide the process of developing human-centred solutions that can bring meaningful change to society.
